# TRANSMACH

## Your trusted smart ticketing partner

### TM Cloud Back-office Features

### User-friendly and comprehensive back-office system

The TM Cloud is a secure, web-based, and user friendly back-office system featuring a personalised dashboard, real-time ticketing and bus tracking, fare management, asset management, vehicle walk-around checks, standard daily reports, and performance and statistics reports.

### Widely accessible with continuous development

The TM Cloud is a SaaS (Software as a Service) based application supported on all web browsers, including mobile phones via the TransMach Cloud mobile app. Another key benefit is that there is no cost for regular system updates, such as the addition of new features.

### Versatile and highly efficient solution

The TM Cloud is fully BODS-compliant and supports multiple SIRI feeds, two-way driver messaging, user-friendly entry forms for fares management, ticket layouts, shift allocation, vehicle management, hot spots, driver alerts, configuration testing and go-live scheduling with multiple fares configuration versions, and more.

### Modular and scalable all-in-one system

The TM Cloud is developed in-house using modern yet mature technologies with an open architecture and modular structure, enabling seamless third-party integrations and additional system add-ons. These include an online booking engine, mobile apps, smartcard portals, POS, and B2B portals-all under one system.
